

API Key Configuration – User Guide

What is it?

API Key Configuration is a feature that allows authorized users to generate and manage secure API keys. These keys are used to authenticate users in the system, enabling them to search, book, and perform other operations seamlessly.

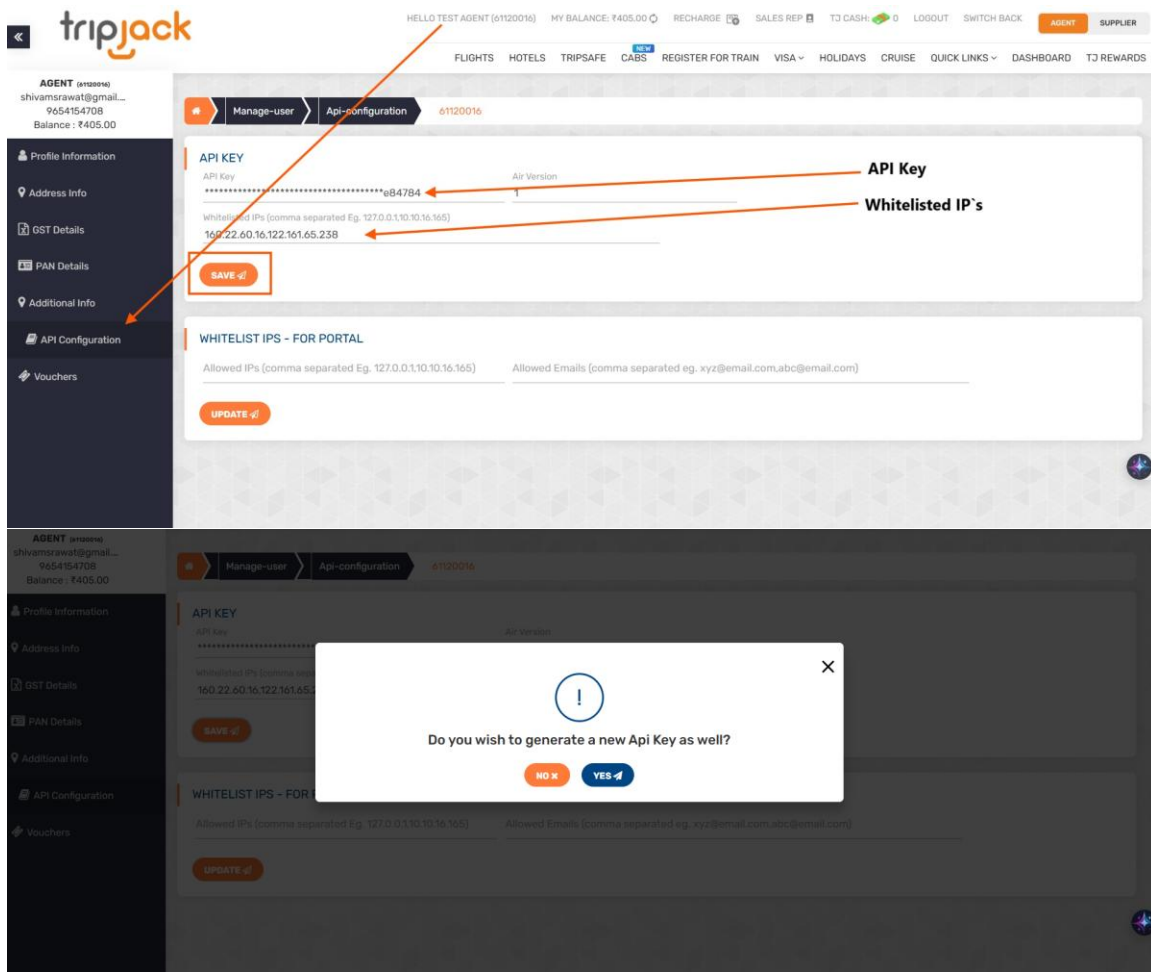

- An API key is a unique, encrypted alphanumeric string (with special characters).
- It identifies an application or an authorized user for secure access.

How does it work?

This feature allows users to generate and manage their own API keys.

Steps to Generate or Update an API Key:

1. Login to your account.
2. Navigate to Manage User → API Configuration (from the left-side menu).
3. You will see the following options:
 - API Key
 - Whitelisted IPs
4. To generate or update:
 - Enter/Update the required Whitelisted IPs.
 - Click SAVE.
5. A confirmation popup will appear:
 - Select YES → Generate a new API key.
 - Select NO → Keep your existing API key unchanged and only update the IPs.

Whitelist IPs

- You can add multiple IP addresses (comma-separated).
- Only these IPs will be allowed to access the system using your API key.
- This ensures security by limiting API usage to authorized IPs only.

Important Notes

- Whenever you revisit the API Configuration page, the API Key will be masked. Copy and save it securely when you generate it the first time.
- Use Whitelist IPs to prevent your API key from being exposed to all users.
- Never share API Keys through email, SMS, or with third parties. This may compromise your system's security.

The system does not support IPv6. Please disable IPv6 before requesting API, otherwise it may result in an "Access Denied" error.
